de Nadal E., Colotet J., Posas F., Serrano R., Gomez N., Arino J.;

"The yeast halotolerance determinant Hallp is an inhibitory subunit of the prain Ser/The protein phosphatase.";

Proc. Natl. Acad. Sci. U.S.A. 95:7357-7362(1988).

1- FUNCTION: MAY STIMULATE EXPESSION OF CERTAIN GENES THAT ARE PERIODICALLY EXPRESSED DURING LATE G1. ALSO MODULATES THE EXPRESSION OF THE ENAI ATPASE. INTERACTS WITH THE C-TERMINAL DOMAIN OF THE SERINE-HIREDNINE PROTEIN PHOSPHATASE PPZ1 AND ACTS AS AN INHIBITORY SUBUNIT OF PPZ1.

1- SUBCELLULAR LOCATION: NUCLEAR OR CYTOPLASMIC.

1- SIMILARITY: TOC. TROPICALIS SISZ/HALJ AND TO YEAST YKL088W. SOME,

TO A. THALLIANA HALJA AND HALJB.

DISEASE: DEFECTS IN CPS1 ARE THE CAUSE OF AN AUTOSOMAL RECESSIVE
METABOLIC DISORDER THAT, CAUSE A TYPE OF HYPERAMMONEMIA. CLINICAL
SYMPTOMS ARE VOMITING:IN'INFANCY, PROTEIN INTOLERANCE.
INTERMITTENT ATAXIA, SEIZURES, LETHARGY, AND MENTAL RETARDATION.
SIMILARITY: TO OTHER CARBANOYL-PHOSPHATE SYMPHETASES. ALSO
COMTAINS A GLUTAMNINE ANLODTRANSFERASE-LIKE DOMAIN BUT THE CYSTEINE
RESIDUE WHICH IS ESSENTIAL FOR AMIDO TRANSFERASE ACTIVITY, IS
MISSING IN THIS PROTEIN SO THIS DOMAIN IS NO LONGER ACTIVE.

It is produced through a collaboration
DEHYDROGENASE (E1), DIHYDROLIPOAMIDE SUCCINYLTRANSFERASE (E2) AND LIPOAMIDE DEHYDROGENASE (E3) (BY SIMILARITY).

-! CATALYTIC ACTIVITY: SUCCINYL-COA + DIHYDROLIPOAMIDE - COA + S-SUCCINYLDIHYDROLIPOAMIDE.

-! COPACTOR: THE E2 COMPONENT CONTAINS ONE COVALENTLY-BOUND LIPOYL COPACTOR (BY SIMILARITY).

-! SUBUNIT: FORMS A 24-POLYPEPTIDE STRUCTURAL CORE WITH OCTAHEDRAL SYMMETRY (BY SIMILARITY).

-! SIMILARITY: BELONGS TO THE 2-OXOACID DEHYDROGENASE FAMILY.

-! SIMILARITY: CONTAINS 1 LIPOYL-BINDING DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EMBL, AP001118; BAB13012.1; -.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1-FUNCTION: ESSENTIAL FOR VIRAL REPLICATION. PLAYS AN IMPORTANT ROLE DURING TRANSCRIPTION OF EARLY MRNAS, PRESUMABLY BY PREVENTING R-LOOP FORMATION BEININD THE ELONGATING RNA POLYMERASE. ACTS AS NTP-DEPENDENT HELICASE THAT CALSES UNIDIRECTIONAL UNWINDING OF 3'TAILED DUPLEX RNAS. MIGHT ALSO PLAY A ROLE IN THE EXDORT OF NEWLY SYNTHESIZED MRNA CHAINS OUT OF THE CORE INVO THE CYTOPLASM. REQUIRED FOR PROPAGATION OF VIRAL PRATICLES (BY SIMILARITY).
-1-CATALYTIC ACTUVITY: NTP + H(2)O = NDP + ORTHOPHOSPHATE.
                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This is the amino acid sequence of the P50 component of the polymerase enhancing factor (PEF) of Pyrococcus furiosus DSM 3638. The sequence is predicted from a DNA sequence (see AAW73847) are the from genomic DNA by PCR. P50 and P45 (see AAW72847) are the predominant components of PEF, which acts to enhance the activity of P furiosus DNA polymerase, thereby providing replication products of greater length and purity. P50 is similar in structure to a bacterial flavoprotein. The invention provides movel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid polymerases, as well as DNA constructs and antibodies raised against P45 or P50. Also included are methods for identifying compositions with Polymerase enhancing activity, for proteins and complexes that function to enhance polymerases to proteins and complexes that function to enhance polymerase activity. Nucleic acid polymerase reactions can be enhanced (claimed) by composition having polymerase enhacing activity. Kits are provided for replicating nucleic acid sequencing or amplification composition having nucleic acid sequencing or amplification site-directed mutagenesis, nucleic acid sequencing or amplification or amplification or amplification or amplification or amplification or amplification or amplification.
                                                                                                                                                                                                                                                                                                                                                                     Polymerase enhancing factor proteins, extracts and complexes -

301

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81150, from Staphylococcus epidermidis.

(II), given in AAG81154 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their treatment of S. epidermidis infections, e.g. endocarditis. AAH5391 to AAH5509 represent specifically claimed S. epidermidis genomic DNA antibious contained sequences from the present invention. AAH55091 to AAH5509 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N. B. The present invention specifically claims all the polynucleotide sequence listing of the present specification, however the sequence listing of the present specification, though sequences are given in the sequence listing of the present specification, though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no even the present for SEQ ID NO:4465 to 4472, Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis S. epidermidis open reading frame protein sequence SEQ ID NO:2576. Staphylococcus epidermidis SR1 strain; infection; diagnosis; vaccination; endocarditis. 361 LEAFGSEENQVVLIGRDFTKELPKMKKRELAERIWDEIEKXLS 403 Claim 18; Page 675; 2188pp; English. AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleocides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and pyrimidine bases –

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
